

Build An Interactive Card Details

Due Date: 27th September, 2022 23:59:59

- Using React, build out this **Interactive Card Details** Component.

- Your users should be able to:

- Fill in the form and see the card details update in real-time
 - Receive error messages when the form is submitted if:
 - Any input field is empty
 - The card number, expiry date, or CVC fields are in the wrong format
 - View the optimal layout depending on their device's screen size
 - See hover, active, and focus states for interactive elements on the page
- Check the **style guide** (style-guide.md), and design files for the different layouts and states to be implemented on your UI.

This project is very similar to the **Tip Calculator** and **Interactive Rating Component** exercises. So feel free to use those as your reference as much as you like.

P.S the original challenge is from [Frontend Mentor](#).
